New results on the \( q \)-generalized Bernoulli polynomials of level \( m \)

https://doi.org/10.1515/dema-2019-0039
Received April 9, 2019; accepted September 17, 2019

Abstract: This paper aims to show new algebraic properties from the \( q \)-generalized Bernoulli polynomials \( B_{n}^{[m-1]}(x; q) \) of level \( m \), as well as some others identities which connect this polynomial class with the \( q \)-generalized Bernoulli polynomials of level \( m \), as well as the \( q \)-gamma function, and the \( q \)-Stirling numbers of the second kind and the \( q \)-Bernstein polynomials.

Keywords: \( q \)-generalized Bernoulli polynomials, \( q \)-gamma function, \( q \)-Stirling numbers, \( q \)-Bernstein polynomials

MSC 2010: 33E12

1 Introduction

Fix a fixed \( m \in \mathbb{N} \), the generalized Bernoulli polynomials of level \( m \) are defined by means of the following generating function [1]

\[
\frac{z^{m}e^{xz}}{e^{z} - \sum_{l=0}^{m-1} \frac{z^{l}}{l!}} = \sum_{n=0}^{\infty} B_{n}^{[m-1]}(x) \frac{z^{n}}{n!}, \quad |z| < 2\pi,
\]

where the generalized Bernoulli numbers of level \( m \) are defined by

\[
B_{n}^{[m-1]}(0) = B_{n}^{[m-1]}, \quad \text{for all } n \geq 0.
\]

We can say that if \( m = 1 \) in (1.1), then we obtain the definition via a generating function, of the classical Bernoulli polynomials \( B_{n}(x) \) and classical Bernoulli numbers, respectively.

The \( q \)-analogue of the classical Bernoulli numbers and polynomials were initially investigated by Carlitz [2]. More recently, J. Choi, T. Ernst, D. Kim, S. Nacl, C.S. Ryoo [3–8] defined the \( q \)-Bernoulli polynomials using different methods and studied their properties. There are numerous recent investigations on \( q \)-generalizations of this subject by many others authors; see [9–17]. More recently, Mahmudov et al. [18] used the \( q \)-Mittag-Leffler function

\[
E_{1,m+1}(z; q) := \frac{z^{m}}{\lambda e_{q}^{z} - \sum_{h=0}^{m-1} \frac{z^{h}}{h!}}, \quad m \in \mathbb{N},
\]

to define the generalized \( q \)-Apostol Bernoulli numbers and \( q \)-Apostol Bernoulli polynomials in \( x, y \) of order \( a \) and level \( m \) using the following generating functions, respectively

\[
\left( \frac{z^{m}}{\lambda e_{q}^{z} + T_{m-1,q}(z)} \right)^{a} = \sum_{n=0}^{\infty} B_{n}^{[m-1,a]}(\lambda) \frac{z^{n}}{[n]_{q}!},
\]

The paper is organized as follows. Section 2 contains the basic backgrounds about the $q$-analogue of the generalized Bernoulli polynomials of level $m$, and some other auxiliary results which we will use throughout the paper. In the Section 3, we introduce some relevant algebraic and differential properties of the $q$-generalized Bernoulli polynomials of level $m$. Finally, in Section 4, we show the corresponding relations between $q$-generalized Bernoulli polynomials of level $m$ and the $q$-gamma function, as well as the $q$-Stirling numbers of the second of the kind and the $q$-Bernstein polynomials.

## 2 Previous definitions and notations

In this paper, we denote by $\mathbb{N}, \mathbb{N}_0, \mathbb{R}, \mathbb{R}^+$, and $\mathbb{C}$ the sets of natural, nonnegative integer, real, positive real and complex numbers, respectively. The following $q$-standard definitions and properties can be found in [19–23].

The $q$-numbers and $q$-factorial numbers are defined respectively by

$$[z]_q = \frac{1 - q^z}{1 - q}, \quad z \in \mathbb{C}, \quad q \in \mathbb{C} \setminus \{1\}, \quad q^q = 1,$$

$$[n]_q! = \prod_{k=1}^{n} [k]_q = [1]_q[2]_q[3]_q \cdots [n]_q, \quad [0]_q! = 1, \quad n \in \mathbb{N}.$$

The $q$-shifted factorial is defined as

$$(a; q)_0 = 1, \quad (a; q)_n = \prod_{j=0}^{n-1} (1 - q^j a), \quad n \in \mathbb{N},$$

$$(a; q)_\infty = \prod_{j=0}^{\infty} (1 - q^j a), \quad a, q \in \mathbb{C}; \quad |q| < 1.$$

The $q$-binomial coefficient is defined by

$$\binom{n}{k}_q = \frac{[n]_q!}{[k]_q![n-k]_q!} = \frac{(q; q)_n}{(q; q)_k(q; q)_{n-k}}, \quad (n, k \in \mathbb{N}_0; 0 \leq k \leq n).$$

The $q$-analogue of the function $(x + y)^n$ is defined by

$$(x + y)_q^n := \sum_{k=0}^{n} \binom{n}{k}_q q^{\frac{k(k-1)}{2}} x^{n-k} y^k, \quad n \in \mathbb{N}_0,$$

$$(1 - a)_q^n = (a; q)_n = \sum_{k=0}^{n} \binom{n}{k}_q q^{\frac{k(k-1)}{2}} (-1)^k a^k = \prod_{j=0}^{n-1} (1 - q^j a).$$
The $q$-derivative of a function $f(z)$ is defined by

$$D_q f(z) = \frac{d_q f(z)}{d_q z} = \frac{f(qz) - f(z)}{(q - 1)z}, \quad 0 < |q| < 1, \quad \forall z \in \mathbb{C}.$$ 

The $q$-analogue of the exponential function is defined in two ways

$$e_q^z = \sum_{n=0}^{\infty} \frac{z^n}{[n]_q!} = \prod_{k=0}^{\infty} \frac{1}{(1 - (1 - q)q^k z)}, \quad 0 < |q| < 1, \quad |z| < \frac{1}{|1 - q|} \tag{2.1}$$

$$E_q^z = \sum_{n=0}^{\infty} \frac{q^{n(n-1)/2} z^n}{[n]_q!} = \prod_{k=0}^{\infty} (1 + (1 - q)q^k z), \quad 0 < |q| < 1, \quad z \in \mathbb{C}.$$ 

In this sense, we can see that

$$e_q^z \cdot E_q^z = 1, \quad e_q^z \cdot E_q^w = e_q^{z+w}.$$ 

Therefore,

$$D_q e_q^z = e_q^z, \quad D_q E_q^z = E_q^{qz}.$$ 

**Definition 2.1.** For any $t > 0$

$$\Gamma_q(t) = \int_0^{\infty} x^{t-1} E_q^{-qx} d_q x$$

is called the $q$-gamma function.

The Jackson’s $q$-gamma function is defined in [20, 24] as follows

$$\Gamma_q(x) = \frac{(q; q)_\infty}{(q^x; q)_\infty} (1 - q)^{1-x}, \quad 0 < |q| < 1,$$

replacing $x$ by $n + 1$ we have

$$\Gamma_q(n + 1) = \frac{(q; q)_\infty}{(q^{n+1}; q)_\infty} (1 - q)^{-n} = (q; q)_n (1 - q)^{-n} = [n]_q!, \quad n \in \mathbb{N}.$$ 

Furthermore, it satisfies the following relations

$$\Gamma_q(1) = 1, \quad \Gamma_q(n) = [n - 1]_q!, \quad \Gamma_q(x + 1) = [x]_q \Gamma_q(x).$$ 

**Definition 2.2.** [25] For $\alpha, \beta, \gamma \in \mathbb{C}, \ Re(\alpha) > 0, \ Re(\beta) > 0, \ Re(\gamma) > 0$ and $|q| < 1$ the function $E_{a, b}^\gamma(z; q)$ is defined as

$$E_{a, b}^\gamma(z; q) = \sum_{n=0}^{\infty} \frac{(q^\gamma; q)_n}{(q^{an + \beta}; q)^n} z^n \Gamma_q(an + \beta).$$

Note that when $\gamma = 1$ the equation above is expressed as

$$E_{a, b}(z; q) = \sum_{n=0}^{\infty} \frac{z^n}{\Gamma_q(an + \beta)}.$$ 

From (2.2), setting $\alpha = 1$ and $\beta = m + 1$, we can deduce that

$$\sum_{n=0}^{\infty} \frac{z^n}{\Gamma_q(n + m + 1)} = \sum_{n=0}^{\infty} \frac{z^n}{[n + m]_q!} = \frac{1}{z^m} \sum_{h=0}^{\infty} \frac{z^h}{[h]_q!} = \left( e_q^z - \sum_{h=0}^{m-1} \frac{z^h}{[h]_q!} \right) \frac{z^m}{z^m}.$$ 

\[ (2.3) \]
The $q$-Stirling number of the first kind $s(n, k)_q$ and the $q$-Stirling number of the second kind $S(n, k)_q$ are the coefficients in the expansions, (see [26, p.173])

\[
(x)_{n; q} = \sum_{k=0}^{n} s(n, k)_q x^k, \\
x^n = \sum_{k=0}^{n} S(n, k)_q (x)_{k, q},
\]

where

\[
(x)_{k, q} = \prod_{n=0}^{k-1} (x - [n]_q).
\]

Let $C[0, 1]$ denote the set of continuous functions on $[0, 1]$. For any $f \in C[0, 1]$, the $q$-Bernstein operator of order $n$ for $f$ and is defined as (see [15, p.3 Eq. (28)])

\[
B_n(f; x) = \sum_{r=0}^{n} f_r \binom{n}{r}_q x^r \prod_{s=0}^{n-r-1} (1 - q^s x) = \sum_{r=0}^{n} f_r b_{n, r}(x),
\]

where $f_r = f([r]_q/[n]_q)$. The $q$-Bernstein polynomials of degree $n$ or a $q$-Bernstein basis are defined by

\[
b_{n, r}(x) = \binom{n}{r}_q x^r \prod_{s=0}^{n-r-1} (1 - q^s x).
\]

We know that \( \sum_{k=0}^{n-j} b_{n-j, k}(x) = 1 \), and so

\[
x^j = \sum_{k=0}^{n-j} \binom{n-j}{k}_q \prod_{t=0}^{k-1} (1 - q^t x) b_{n, k}(x).
\]

By using the identity

\[
\binom{n-j}{k}_q = \binom{n}{k}_q \binom{k}{j}_q,
\]

we have

\[
x^j = \sum_{k=0}^{n-j} \binom{k}{j}_q \prod_{t=0}^{k-1} (1 - q^t x) b_{n, k}(x).
\]

Otherwise, setting $\alpha = \lambda = 1$ in the equation (1.2), we have the following definition:

**Definition 2.3.** Let $m \in \mathbb{N}$, $z \in \mathbb{C}$, $0 < |q| < 1$. The $q$-generalized Bernoulli polynomials $B_n^{[m-1]}(x; q)$ of level $m$ are defined in a suitable neighborhood of $z$ by means of the generating function

\[
\left( \frac{z^m}{e_q^z - \sum_{i=1}^{m-1} \frac{z^i}{[i]_q}} \right) e_q^{xz} e_q^{z^2} = \sum_{n=0}^{\infty} B_n^{[m-1]}(x + y; q) \frac{z^n}{[n]_q}, \quad |z| < 2\pi,
\]

where the $q$-generalized Bernoulli numbers of level $m$ are defined by

\[
B_n^{[m-1]}(q) := B_n^{[m-1]}(0; q).
\]

Furthermore,

\[
B_n^{[m-1]}(x, y; q) := B_n^{[m-1]}(x + y; q),
\]

\[
B_n^{[m-1]}(x, 0; q) := B_n^{[m-1]}(x; q),
\]

\[
B_n^{[m-1]}(0, y; q) := B_n^{[m-1]}(y; q).
\]
The first three \(q\)-generalized Bernoulli polynomials of level \(m\) (cf. [18, p.7]) are
\[
B_{0}^{(m-1)}(x; q) = [m]_q!,
\]
\[
B_{1}^{(m-1)}(x; q) = [m]_q!(x - \frac{1}{[m + 1]_q}),
\]
\[
B_{2}^{(m-1)}(x; q) = [m]_q!(x^2 - \frac{[2]_q x}{[m + 1]_q} + \frac{[2]_q q^{m+1}}{[m + 2]_q[m + 1]_q^2}).
\]

Also, the first three \(q\)-generalized Bernoulli numbers of level \(m\) are
\[
B_{0}^{(m-1)}(q) = [m]_q!,
\]
\[
B_{1}^{(m-1)}(q) = \frac{[m]_q!}{[m + 1]_q},
\]
\[
B_{2}^{(m-1)}(q) = \frac{[2]_q [m]_q! q^{m+1}}{[m + 2]_q[m + 1]_q^2}.
\]

**Definition 2.4.** [14] Let \(q, \alpha \in \mathbb{C}, 0 < |q| < 1\). The \(q\)-Bernoulli polynomials in \(x, y\) of order \(\alpha\) are defined by means of the generating function
\[
\left(\frac{z}{e_q^x - 1}\right)^{\alpha} e_q^x E_q^y = \sum_{n=0}^{\infty} B^{(a)}_n(x, y; q) \frac{z^n}{[n]_q!}, \quad |z| < 2\pi,
\]
(2.7)
where the \(q\)-Bernoulli numbers of order \(\alpha\) are defined by
\[
B^{(a)}_n(q) := B^{(a)}_n(0, 0; q).
\]
Furthermore
\[
B^{(a)}_n(x, q) := B^{(a)}_n(x, 0; q),
\]
\[
B^{(a)}_n(y, q) := B^{(a)}_n(0, y; q).
\]

**3 Properties of the \(q\)-generalized Bernoulli polynomials of level \(m\)**

In this section, we show some properties of the \(q\)-generalized Bernoulli polynomials \(B_{n}^{(m-1)}(x; q)\) of level \(m\). We demonstrated the facts for one of them. Obviously, by applying a similar technique, other ones can be determined. The following proposition summarizes some properties of the polynomials \(B_{n}^{(m-1)}(x; q)\). We will only show in details the proofs to (2), (5) and (7).

**Proposition 3.1.** Let a fixed \(m \in \mathbb{N}, n, k \in \mathbb{N}_0\) and \(q \in \mathbb{C}, 0 < |q| < 1\). Let \(\left\{B_{n}^{(m-1)}(x; q)\right\}_{n=0}^{\infty}\) be the sequence of \(q\)-generalized Bernoulli polynomials of level \(m\). Then the following statements hold.

1. **Summation formula.** For every \(n \geq 0\)
\[
B_{n}^{(m-1)}(x; q) = \sum_{k=0}^{n} \binom{n}{k} B_{k}^{(m-1)}(q)x^{n-k}.
\]
(3.1)

2. For \(n \geq 1\)
\[
\sum_{k=0}^{n} \binom{n + m}{k} B_{k}^{(m-1)}(q) = 0.
\]
To prove (2), we start with (2.1) and (2.6), from which it follows that

$$z^m = \left( \sum_{n=0}^{\infty} B_n^{[m-1]}(q) \frac{z^n}{[n]_q!} \right) \left( \sum_{h=m}^{\infty} \frac{z^h}{[h]_q!} \right) = \left( \sum_{n=0}^{\infty} B_n^{[m-1]}(q) \frac{z^n}{[n]_q!} \right) \left( \sum_{j=0}^{\infty} \frac{z^j}{[j]_q!} \right).$$

and therefore

$$1 = \left( \sum_{n=0}^{\infty} B_n^{[m-1]}(q) \frac{z^n}{[n]_q!} \right) \left( \sum_{j=0}^{\infty} \frac{z^j}{[j]_q!} \right).$$
By multiplying (2.6) and (2.7), we have
\[
\begin{aligned}
\sum_{n=0}^{\infty} \sum_{k=0}^{n} B_{k}^{(m-1)}(q) \frac{z^n}{[k]_q!} \cdot \frac{z^n}{[n-k+m]_q!} = B_{0}^{(m-1)}(q) \frac{[m]_q!}{[m]_q!} + \sum_{n=1}^{\infty} \sum_{k=0}^{n} \frac{B_{k}^{(m-1)}(q)}{[k]_q!} \cdot \frac{z^n}{[n-k+m]_q!}.
\end{aligned}
\]

By comparing coefficients of \(\frac{z^n}{[n]_q!}\), we have
\[
1 = \frac{B_{0}^{(m-1)}(q)}{[m]_q!} \quad \Rightarrow \quad B_{0}^{(m-1)}(q) = [m]_q!
\]

and
\[
\sum_{n=0}^{\infty} \frac{B_{k}^{(m-1)}(q)}{[k]_q!} \frac{z^n}{[n-k+m]_q!} = 0.
\]

By multiplying \([n + m]_q!\) on both sides of the equation above, we have
\[
\sum_{k=0}^{n} B_{k}^{(m-1)}(q) \frac{[n + m]_q!}{[k]_q!} \frac{z^n}{[n-k+m]_q!} = 0 \quad \Rightarrow \quad \sum_{k=0}^{n} n \cdot m + k \cdot \binom{n}{k} B_{k}^{(m-1)}(q) = 0.
\]

**Proof.** Proof of (5). Considering the expression \(B_{n}^{(m-1)}(1+y; q) - B_{n}^{(m-1)}(y; q)\) and using the generating functions (2.6) and (2.7), we have
\[
\begin{aligned}
I := \sum_{n=0}^{\infty} B_{n}^{(m-1)}(1+y; q) \frac{z^n}{[n]_q!} - \sum_{n=0}^{\infty} B_{n}^{(m-1)}(y; q) \frac{z^n}{[n]_q!} = \left( \frac{z^m}{e^z - \sum_{l=0}^{m-1} \frac{z^l}{[l]_q!}} \right) B_{n}^{(m)}(e^z - 1)
\end{aligned}
\]
\[
= z \sum_{n=0}^{\infty} B_{n}^{(m-1)}(y; q) \frac{z^n}{[n]_q!} \sum_{n=0}^{\infty} B_{n}^{(-1)}(q) \frac{z^n}{[n]_q!}.
\]

Therefore
\[
I = \sum_{n=0}^{\infty} B_{n}^{(m-1)}(y; q) \frac{z^n}{[n]_q!} \sum_{n=1}^{\infty} B_{n}^{(-1)}(q) \frac{z^n}{[n-1]_q!} = \sum_{n=1}^{\infty} \sum_{k=0}^{n-1} B_{k}^{(m-1)}(y; q) \frac{z^k}{[k]_q!} B_{n-1-k}^{(-1)}(q) \frac{z^{n-k}}{[n-1-k]_q!}.
\]
\[
= \sum_{n=1}^{\infty} \sum_{k=0}^{n-1} \binom{n-1}{k} B_{k}^{(m-1)}(y; q) B_{n-1-k}^{(-1)}(q) \frac{z^n}{[n]_q!}.
\]

By comparing coefficients of \(\frac{z^n}{[n]_q!}\) on both sides we obtain the result. \(\square\)

**Proof.** Proof of (7). From (3.7) we have
\[
B_{n}^{(m-1)}(x; q) = \frac{1}{[n+1]_q} D_{q} q_{n+1}^{(m-1)}(x; q).
\]

Now, by integrating on both sides of the equation above, we get
\[
\int_{x_0}^{x_1} B_{n}^{(m-1)}(x; q) dx = \frac{1}{[n+1]_q} \int_{x_0}^{x_1} D_{q} q_{n+1}^{(m-1)}(x; q) dx.
\]
Proposition 4.1. For second kind and the

Some connection formulas for the polynomials

Setting $x_0 = 0$ and $x_1 = x$ in (3.8), we have

and so

Finally, we get

$$B_n^{[m-1]}(x; q) = [n]_q \int_0^x B_n^{[m-1]}(x; q) \, dq \, x + B_n^{[m-1]}(q).$$

\[\square\]

4 Some connection formulas for the polynomials $B_n^{[m-1]}(x + y; q)$

From identities (2.4), (2.5) and Proposition 3.1 we can deduce some interesting algebraic relations between the $q$-generalized Bernoulli polynomials of level $m$ with the $q$-gamma function, the $q$-Stirling numbers of the second kind and the $q$-Bernstein polynomials.

Proposition 4.1. For $n, j, k \in \mathbb{N}_0$, $q \in \mathbb{C}$ where $0 < |q| < 1$ and where $m \in \mathbb{N}$, the $q$-generalized Bernoulli polynomials of level $m$ are related with the $q$-gamma function by the means of the following identity

$$B_n^{[m-1]}(x + y; q) = [n]_q \frac{\sum_{j=0}^{n} \sum_{k=0}^{n-k} B_j^{[m-1]}(x; q) \frac{q^{j(n-j)(n-j-1)}}{[k]_q! [j]_q! [n-j-k+m+1] q^{(n-j)(n-j-1)}} B_k^{[m-1]}(y; q)}{[n]_q! \sum_{j=0}^{n} \sum_{k=0}^{n-k} B_j^{[m-1]}(x; q) \frac{[n]_q! q^{j(n-j)(n-j-1)}}{[k]_q! [j]_q! [n-j-k+m+1] q^{(n-j)(n-j-1)}} B_k^{[m-1]}(y; q)}.$$

Proof. By substituting (3.6) in (3.3), we have

$$B_n^{[m-1]}(x + y; q) = \sum_{j=0}^{n} \sum_{k=0}^{n-k} B_k^{[m-1]}(x; q) \frac{q^{j(n-j)(n-j-1)}}{[k]_q! [j]_q! [n-j-k+m+1] q^{(n-j)(n-j-1)}} B_k^{[m-1]}(y; q).$$

\[\square\]

Corollary 4.1. For $n, j, k \in \mathbb{N}_0$ and $m \in \mathbb{N}$, we have

$$B_n^{[m-1]}(x; q) = [n]_q! \sum_{k=0}^{n-k} \frac{B_j^{[m-1]}(q) B_k^{[m-1]}(x; q)}{[k]_q! [j]_q! [n-j-k+m+1] q^{(n-j)(n-j-1)}}.$$
**Proof.** By replacing equation (3.6) in (3.1), we obtain

\[ B_n^{[m-1]}(x; q) = \sum_{j=0}^{n} \binom{n}{j} B_j^{[m-1]}(q) \sum_{k=0}^{n-j} \frac{[n-j]_q! B_k^{[m-1]}(x; q)}{[k]_q! [n-j-k+m+1]_q!} \]

\[ = \sum_{k=0}^{n} \sum_{j=0}^{n-k} \frac{[n]_q! B_j^{[m-1]}(x; q)}{[k]_q! [j]_q! [n-j-k+m+1]_q!} \]

\[ = \frac{n}{[n]_q!} \sum_{k=0}^{n-k} \sum_{j=0}^{n} B_j^{[m-1]}(q) B_k^{[m-1]}(x; q) \left\{ \frac{k}{[k]_q! [j]_q!} \right\} \left\{ \frac{n-j-k+m+1}{[n-j-k+m+1]_q!} \right\}. \]

**Corollary 4.2.** For \( n, j, k \in \mathbb{N}_0 \) and \( m \in \mathbb{N} \), we have

\[ B_n^{[m-1]}(x; q) = \sum_{k=0}^{n} \sum_{j=0}^{n-k} \frac{[n]_q! B_j^{[m-1]}(x; q)}{[k]_q! [j]_q! [n-j-k]_q!}. \]

**Proof.** By substituting (3.4) in equation (3.1), we obtain

\[ B_n^{[m-1]}(x; q) = \sum_{j=0}^{n} \binom{n}{j} B_j^{[m-1]}(q) \sum_{k=0}^{n-j} \frac{[n-j]_q! B_k^{[m-1]}(x; q)}{[k]_q! [n-j-k+m]_q!} \]

\[ = \sum_{k=0}^{n} \sum_{j=0}^{n-k} \frac{[n]_q! B_j^{[m-1]}(x; q)}{[k]_q! [j]_q! [n-j-k+m]_q!} B_k^{[m-1]}(q) B_n^{[m-1]}(x; q) \]

\[ = \sum_{k=0}^{n} \sum_{j=0}^{n-k} \frac{[n]_q! B_j^{[m-1]}(x; q)}{[k]_q! [j]_q! [n-j-k]_q!}. \]

**Corollary 4.3.** For \( n, j, k \in \mathbb{N}_0 \) and \( m \in \mathbb{N} \)

\[ B_n^{[m-1]}(x+y; q) = [n]_q! \sum_{k=0}^{n-j} \frac{B_j^{[m-1]}(x; q)}{[j]_q! [n-j+m-k]_q!}. \]

**Proof.** By substituting the equation (3.5) in (3.2), we obtain

\[ B_n^{[m-1]}(x+y; q) = \sum_{j=0}^{n} \binom{n}{j} q^{\frac{j}{2}(n-j)(n-j-1)} B_j^{[m-1]}(x; q) \sum_{k=0}^{n-j} \frac{[n-j]_q! B_k^{[m-1]}(y; q)}{[k]_q! [n-j-k+m]_q!} \]

\[ = \sum_{j=0}^{n} \sum_{k=0}^{n-j} \frac{[n]_q! B_j^{[m-1]}(x; q)}{[n-j+m-k]_q!} B_k^{[m-1]}(y; q) \]

\[ = \sum_{j=0}^{n} \sum_{k=0}^{n-j} \frac{[n]_q! B_j^{[m-1]}(x; q)}{[n-j+m-k]_q!}. \]

**Proposition 4.2.** For \( n, j, k \in \mathbb{N}_0 \), \( q \in \mathbb{C} \) where \( 0 < |q| < 1 \) and where \( m \in \mathbb{N} \), the \( q \)-generalized Bernoulli polynomials of level \( m \) are related with the \( q \)-Stirling numbers of the second kind \( S(n, k; q) \) by means of the following identities

\[ B_n^{[m-1]}(x+y; q) = \sum_{k=0}^{n-j} \frac{[n]_q! q^{\frac{j}{2}(n-j)(n-j-1)} B_j^{[m-1]}(y; q) S(n-j, k; q)(x; q)}, \]

\[ B_n^{[m-1]}(x; q) = \sum_{k=0}^{n-j} \frac{B_j^{[m-1]}(q) S(j, k; q)(x; q)}. \]
Proof. Proof of (4.5). By replacing (2.4) in (3.3), we have
\[
B_{n}^{[m-1]}(x + y; q) = \sum_{j=0}^{n} \sum_{k=0}^{n-j} \binom{n}{j} q^{\frac{j(n-j)}{m}} B_{j}^{[m-1]}(y; q) \sum_{k=0}^{n-j} S(n-j, k; q) x_{q,k}.
\]

Proof. Proof of (4.6). By substituting (2.4) in (3.1), we have
\[
B_{n}^{[m-1]}(x; q) = \sum_{j=0}^{n} \sum_{k=0}^{j} \binom{n}{j} B_{n-j}^{[m-1]}(q) S(j, k; q) x_{q,k}.
\]

Corollary 4.4. For \( n, k \in \mathbb{N}_0 \) and \( m \in \mathbb{N} \), we obtain
\[
\sum_{n=0}^{\infty} S(n, k) q x_{q,k} = \sum_{n=0}^{\infty} \binom{n}{k} q^{rac{k}{m}} B_{n}^{[m-1]}(x; q).
\]

Proposition 4.3. For \( n, j, k \in \mathbb{N}_0, q \in \mathbb{C} \) where \( 0 < |q| < 1 \) and where \( m \in \mathbb{N} \) the \( q \)-generalized Bernoulli polynomials of level \( m \) are related with the \( q \)-Bernstein polynomials \( b_{n,k}(x; q) \) by means of the following identities
\[
B_{n}^{[m-1]}(x, q) = \sum_{j=0}^{n} \sum_{k=0}^{n-j} \binom{n-j}{k} q^{\frac{k}{m}} b_{n,k}(x; q),
\]
\[
B_{n}^{[m-1]}(x + y; q) = \sum_{j=0}^{n} \sum_{k=0}^{n-j} \binom{n-j}{k} q^{\frac{k}{m}} b_{n,k}(x; q) \sum_{k=0}^{n-j} B_{j}^{[m-1]}(y; q) x_{q,k}.
\]

Proof. Proof of (4.7). By replacing (2.5) in (3.1), we have
\[
B_{n}^{[m-1]}(x, q) = \sum_{j=0}^{n} \binom{n}{j} B_{n-j}^{[m-1]}(q) \sum_{k=0}^{n-j} \binom{k}{j} q b_{n,k}(x; q).
\]

Proof. Proof of (4.8). By replacing (2.5) in Equation (3.3), we obtain
\[
B_{n}^{[m-1]}(x + y; q) = \sum_{j=0}^{n} \binom{n}{j} q^{\frac{j(j-1)}{m}} B_{n-j}^{[m-1]}(y; q) \sum_{k=0}^{n-j} \binom{k}{j} q b_{n,k}(x; q).
\]
Corollary 4.5. For \( n, j \in \mathbb{N}_0 \) and \( x \in [0, 1] \), we have

\[
\sum_{k=0}^{n} \binom{n}{k} b_{n,k}(x; q) = \sum_{j=0}^{\frac{j}{k}} \binom{n}{j} \binom{k}{j} B_{q}^{m-1}(j; q) B_{q}^{m-1}(x; q).
\]

Proposition 4.4. For \( n, j, k \in \mathbb{N}_0 \) and \( n \geq j \geq k \geq 0 \), we have

\[
b_{n,k}(x; q) = x^{n-k} \sum_{j=0}^{n-k} \binom{n-j}{k} \binom{n}{j} \frac{[j]! B_{q}^{m-1}(1-x; q)}{[j+m]! \Gamma_q(j+m+1)}, \tag{4.9}
\]

\[
b_{n,k}(x; q) = x^{n-k} \sum_{j=0}^{n-k} \binom{n-j}{k} \binom{n}{j} \frac{[j]! B_{q}^{m-1}(1-x; q)}{[j+m]! \Gamma_q(j+m+1)}. \tag{4.10}
\]

Proof. To prove (4.9), we used the following equality [14, Theorem 19, p. 10]

\[
\frac{x^k z^{k-1} E_q(z x)^{z-1}}{[k]! q!} = \sum_{n=k}^{\infty} b_{n,k}(x; q) \frac{z^n}{[n]! q!}.
\]

We see that

\[
\frac{x^k z^{k-1} E_q(z x)^{z-1}}{[k]! q!} = x^k \sum_{k=0}^{\infty} \frac{e_q^z - \sum_{h=0}^{m-1} \frac{z^h}{[h]! q!}}{z^m} \frac{e_q^z}{[m]! q!} E_q(z x)^{z-1}.
\]

Next, by using the equations (2.3) and (2.6), we get

\[
x^k \sum_{k=0}^{\infty} \frac{z^n}{[n]! q!} = \sum_{n=0}^{\infty} \sum_{j=0}^{n} \frac{x^j}{[j]! q!} \frac{1}{\Gamma_q(j+m+1)} \frac{B_{q}^{m-1}(1-x; q)}{[n-j]!} \frac{z^n}{[n]! q!}.
\]

By comparing coefficients of \( \frac{z^n}{[n]! q!} \) on both sides we obtain

\[
b_{n,k}(x; q) = x^{n-k} \sum_{j=0}^{n-k} \binom{n-j}{k} \binom{n}{j} \frac{[j]! B_{q}^{m-1}(1-x; q)}{[j+m]! \Gamma_q(j+m+1)}.
\]

To demonstrate (4.10) we used the identity \( \Gamma_q(j+m+1) = [j+m]! \) and Equation (4.9). Continuing this process, we get

\[
b_{n,k}(x; q) = x^{n-k} \sum_{j=0}^{n-k} \binom{n-j}{k} \binom{n}{j} \frac{[j]! B_{q}^{m-1}(1-x; q)}{[j+m]! \Gamma_q(j+m+1)}.
\]
