### Abstract:

*In this paper, we define and study a new type of connected spaces called  $\lambda_{co}$ -connected space. It is remarkable that the class of  $\lambda$ -connected spaces is a subclass of the class of  $\lambda_{co}$ -connected spaces. We discuss some characterizations and properties of  $\lambda_{co}$ -connected spaces,  $\lambda_{co}$  components and  $\lambda_{co}$ -locally connected spaces.*

**Keywords:**  $\lambda_{co}$ -connected spaces;  $\lambda_{co}$ -components;  $\lambda_{co}$ -locally connected spaces.

**MSC (2020):** 54A05, 54D30.

## 1. Introduction

Following [3] N. Levine, 1963, defined semi open sets. Similarly, S. F. Namiq [4], defined an operation  $\lambda$  on the family of semi open sets in a topological space called semi operation, denoted by s-operation; via this operation, in his study [7], he defined  $\lambda_{sc}$ -open set by using  $\lambda$ -open and semi closed sets, and also following [5], he defined  $\lambda_{co}$ -open set and investigated several properties of  $\lambda_{co}$ -derived,  $\lambda_{co}$ -interior and  $\lambda_{co}$ -closure points in topological spaces.

In the present article, we define the  $\lambda_{co}$ -connected space, discuss some characterizations and properties of  $\lambda_{co}$ -connected spaces,  $\lambda_{co}$ -components and  $\lambda_{co}$ -locally connected spaces and finally its relations with others connected spaces.

## 2. Preliminaries

In the entire parts of the present paper, a topological space is referred to by  $(X, \tau)$  or simply by  $X$ . First, some definitions are recalled and results are used in this paper. For any subset  $A$  of  $X$ , the closure and the interior of  $A$  are denoted by  $\text{Cl}(A)$  and  $\text{Int}(A)$ , respectively. Following [8], the researchers state that a subset  $A$  of  $X$  is regular closed if  $A = \text{Cl}(\text{Int}(A))$ . Similarly, following [3], a subset  $A$  of a space  $X$  is semi open if  $A \subseteq \text{Cl}(\text{Int}(A))$ . The complement of a semi open set is called semi closed. The family of all semi open (resp. semi closed) sets in a space  $X$  is denoted by  $\text{SO}(X, \tau)$  or  $\text{SO}(X)$  (resp.  $\text{SC}(X, \tau)$  or  $\text{SC}(X)$ ). According to [1], a space  $X$  is stated to be s-connected, if it is not the union of two nonempty disjoint semi open subsets of  $X$ . We consider  $\lambda: \text{SO}(X) \rightarrow P(X)$  as a function defined on  $\text{SO}(X)$  into the power set of  $X$ ,  $P(X)$  and  $\lambda$  is called a semi-operation denoted by s-operation, if  $V \subseteq \lambda(V)$ , for each semi open set  $V$ . It is assumed that  $\lambda(\emptyset) = \emptyset$  and  $\lambda(X) = X$ , for any s-operation. Let  $X$  be a space and  $\lambda: \text{SO}(X) \rightarrow P(X)$  be an s-operation, following [4], a subset  $A$  of  $X$  is called a  $\lambda$ -open set, which is equivalent to  $\lambda_s$ -open set [2], if for each  $x \in A$ , there exists a semi open set  $U$  such that  $x \in U$  and  $\lambda(U) \subseteq A$ . The complement of a  $\lambda$ -open set is called a  $\lambda$ -closed. The family of all  $\lambda$ -open (resp.,  $\lambda$ -closed) subsets of a space  $X$  is denoted by  $\text{SO}_\lambda(X, \tau)$  or  $\text{SO}_\lambda(X)$  (resp.  $\text{SC}_\lambda(X, \tau)$  or  $\text{SC}_\lambda(X)$ ). Following [4], a  $\lambda$ -open subset  $A$  of  $X$  is named a  $\lambda_c$ -open set, if for each  $x \in A$ , there exists a closed set  $F$  such that  $x \in F \subseteq A$ . The family of all  $\lambda_c$ -open (resp.,  $\lambda_c$ -closed) subsets of a space  $X$  is denoted by  $\text{SO}_{\lambda_c}(X, \tau)$  or  $\text{SO}_{\lambda_c}(X)$  (resp.  $\text{SC}_{\lambda_c}(X, \tau)$  or  $\text{SC}_{\lambda_c}(X)$ ). Thus, a number of

definitions are presented and some known results are reiterated which will be used in the sequel.

**Definition 2.1.** [4] Let  $X$  be a space and  $\lambda:SO(X) \rightarrow P(X)$  be an  $s$ -operation, then a subset  $A$  of  $X$  is called a  $\lambda$ -open set if for each  $x \in A$  there exists a semi open set  $U$  such that  $x \in U$  and  $\lambda(U) \subseteq A$ . The complement of a  $\lambda$ -open set is called  $\lambda$ -closed. The family of all  $\lambda$ -open (resp.,  $\lambda$ -closed) subsets of a topological space  $(X, \tau)$  is denoted by  $SO_\lambda(X, \tau)$  or  $SO_\lambda(X)$  (resp.,  $SC_\lambda(X, \tau)$  or  $SC_\lambda(X)$ ).

**Definition 2.2.** [5] A  $\lambda$ -open subset  $A$  of  $X$  is called a  $\lambda_{co}$ -open (resp.,  $\lambda_c$ -open [4]) set if for each  $x \in A$ , there exists a clopen (resp., closed) set  $F$  such that  $x \in F \subseteq A$ . The family of all  $\lambda_c$ -open (resp.,  $\lambda_c$ -closed) subsets of a space  $X$  is denoted by  $SO_{\lambda_c}(X, \tau)$  or  $SO_{\lambda_c}(X)$  (resp  $SC_{\lambda_c}(X, \tau)$  or  $SC_{\lambda_c}(X)$ ). The family of all  $\lambda_{co}$ -open (resp.,  $\lambda_{co}$ -closed) subsets of a space  $X$  is denoted by  $SO_{\lambda_{co}}(X, \tau)$  or  $SO_{\lambda_{co}}(X)$  (resp  $SC_{\lambda_{co}}(X, \tau)$  or  $SC_{\lambda_{co}}(X)$ ).

**Proposition 2.3.** [4],[5] For a space  $X$ ,  $SO_{\lambda_{co}}(X) \subseteq SO_{\lambda_c}(X) \subseteq SO_\lambda(X) \subseteq SO(X)$ .

**Definition 2.4.** [2] Let  $X$  be a space, an  $s$ -operation  $\lambda$  is said to be  $s$ -regular if for every semi open sets  $U$  and  $V$  containing  $x \in X$ , there exists a semi open set  $W$  containing  $x$  such that  $\lambda(W) \subseteq \lambda(U) \cap \lambda(V)$ .

**Definition 2.5.** [6] A space  $X$  is said to be  $\lambda$ -connected if there does not exist a pair  $A, B$  of nonempty disjoint  $\lambda$ -open subset of  $X$  such that  $X = A \cup B$ , otherwise  $X$  is called  $\lambda$ -disconnected. In this case, the pair  $(A, B)$  is called a  $\lambda$ -disconnection of  $X$ .

Following [5], we used some results:

**Definition 2.6.** Let  $X$  be a space and  $A$  a subset of  $X$ . Then:

1. The  $\lambda_{co}$ -closure of  $A$ , denoted by  $\lambda_{co}Cl(A)$  is the intersection of all  $\lambda_{co}$ -closed sets containing  $A$ .
2. The  $\lambda_{co}$ -interior of  $A$ , denoted by  $\lambda_{co}Int(A)$  is the union of all  $\lambda_{co}$ -open sets of  $X$  contained in  $A$ .
3. A point  $x \in X$  is said to be a  $\lambda_{co}$ -limit point of  $A$  if every  $\lambda_{co}$ -open set containing  $x$  contains a point of  $A$  different from  $x$ , and the set of all  $\lambda_{co}$ -limit points of  $A$  is called the  $\lambda_{co}$ -derived set of  $A$ , denoted by  $\lambda_{co}D(A)$ .

**Proposition 2.7.** For each point  $x \in X$ ,  $x \in \lambda_{co}Cl(A)$  if and only if  $V \cap A \neq \emptyset$ , for every  $V \in SO_{\lambda_{co}}(X)$  such that  $x \in V$ .

**Proposition 2.8.** Let  $\{A_\alpha\}_{\alpha \in I}$  be any collection of  $\lambda_{co}$ -open sets in a topological space  $(X, \tau)$ , then  $\cup_{\alpha \in I} A_\alpha$  is a  $\lambda_{co}$ -open set.

**Example 2.9.** Let  $X = \{a, b, c\}$  and  $\tau = P(X)$ . We define an  $s$ -operation  $\lambda: SO(X) \rightarrow P(X)$  as:

$$\lambda(A) = \begin{cases} A & \text{if } A \neq \{a\}, \{b\}, \\ X & \text{otherwise.} \end{cases}$$

Now, we have  $\{a, b\}$  and  $\{b, c\}$  are  $\lambda_{co}$ -open sets, but  $\{a, b\} \cap \{b, c\} = \{b\}$  is not  $\lambda_{co}$ -open.

**Proposition 2.10.** Let  $\lambda$  be an  $s$ -operation and  $s$ -regular. If  $A$  and  $B$  are  $\lambda_{co}$ -open sets in  $X$ , then  $A \cap B$  is also a  $\lambda_{co}$ -open set.

**Proposition 2.11.** Let  $X$  be a space and  $A \subseteq X$ . Then  $A$  is a  $\lambda_{co}$ -closed subset of  $X$  if and only if  $\lambda_{co}D(A) \subseteq A$ .

**Proposition 2.12.** For subsets  $A, B$  of a space  $X$ , the following statements are true.

1.  $A \subseteq \lambda_{co}Cl(A)$ .
2.  $\lambda_{co}Cl(A)$  is a  $\lambda_{co}$ -closed set in  $X$ .
3.  $\lambda_{co}Cl(A)$  is a smallest  $\lambda_{co}$ -closed set, containing  $A$ .
4.  $A$  is a  $\lambda_{co}$ -closed set if and only if  $A = \lambda_{co}Cl(A)$ .
5.  $\lambda_{co}Cl(\emptyset) = \emptyset$  and  $\lambda_{co}Cl(X) = X$ .
6. If  $A$  and  $B$  are subsets of the space  $X$  with  $A \subseteq B$ . Then  $\lambda_{co}Cl(A) \subseteq \lambda_{co}Cl(B)$ .
7. For any subsets  $A, B$  of a space  $X$ .  $\lambda_{co}Cl(A) \cup \lambda_{co}Cl(B) \subseteq \lambda_{co}Cl(A \cup B)$ .
8. For any subsets  $A, B$  of a space  $X$ .  $\lambda_{co}Cl(A \cap B) \subseteq \lambda_{co}Cl(A) \cap \lambda_{co}Cl(B)$ .

**Proposition 2.13.** Let  $X$  be a space and  $A \subseteq X$ . Then  $\lambda_{co}Cl(A) = A \cup \lambda_{co}D(A)$ .

### 3. $\lambda_{co}$ -Connected Spaces

In this section, we define, study and characterize the  $\lambda_{co}$ -connected space, finally some of its properties are established.

We start this section with the following definitions.

**Definition 3.1.** Let  $X$  be a space and  $Y \subseteq X$ . Then the class of  $\lambda_{co}$ -open sets in  $Y$  denoted by  $SO_{\lambda_{co}}(Y)$ , is defined in a natural way as:  $SO_{\lambda_{co}}(Y) = \{Y \cap V : V \in SO_{\lambda_{co}}(X)\}$ . That is,  $W$  is  $\lambda_{co}$ -open in  $Y$  if and only if  $W = Y \cap V$ , where  $V$  is a  $\lambda_{co}$ -open set in  $X$ . Thus,  $Y$  is a subspace of  $X$  with respect to  $\lambda_{co}$ -open set.

**Definition 3.2.** A space  $X$  is said to be  $\lambda_{co}$ -connected if there does not exist a pair  $A, B$  of nonempty disjoint  $\lambda_{co}$ -open subset of  $X$  such that  $X = A \cup B$ , otherwise  $X$  is called  $\lambda_{co}$ -disconnected. In this case, the pair  $(A, B)$  is called a  $\lambda_{co}$ -disconnection of  $X$ .

**Definition 3.3.** Let  $X$  be a space and  $\lambda: SO(X) \rightarrow P(X)$  an  $s$ -operation, then the family  $SO_{\lambda_{co}}(X)$  is called  $\lambda_{co}$ -indiscrete space if  $SO_{\lambda_{co}}(X) = \{\emptyset, X\}$ .

**Definition 3.4.** Let  $X$  be a space and  $\lambda: SO(X) \rightarrow P(X)$  an  $s$ -operation then the family  $SO_{\lambda_{co}}(X)$  is called a  $\lambda_{co}$ -discrete space if  $SO_{\lambda_{co}}(X) = P(X)$ .

**Example 3.5.** Every  $\lambda_{co}$ -indiscrete space is  $\lambda_{co}$ -connected.

We give in below a characterization of  $\lambda_{co}$ -connected spaces, the proof of which is straight forward.

**Theorem 3.6.** A space  $X$  is  $\lambda_{co}$ -disconnected (resp.  $\lambda_{co}$ -connected) if and only if there exists (resp., does not exist) a nonempty proper subset  $A$  of  $X$ , which is both  $\lambda_{co}$ -open and  $\lambda_{co}$ -closed in  $X$ .

**Theorem 3.7.** Every  $\lambda$ -connected space is  $\lambda_{co}$ -connected.

Let  $X$  be  $\lambda$ -connected, then there does not exist a pair  $A, B$  of nonempty disjoint  $\lambda$ -open subset of  $X$  such that  $X = A \cup B$ , but every  $\lambda_{co}$ -open set is a  $\lambda$ -open set by Proposition 2.3, so there does not exist a pair  $A, B$  of nonempty disjoint  $\lambda_{co}$ -open subset of  $X$  such that  $X = A \cup B$ . Thus  $X$  is  $\lambda_{co}$ -connected.

The converse of Theorem 3.7, is not true in general as it is shown by the following example.

**Example 3.8.** Let  $X = \{a, b, c\}$ , and  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ . We define an  $s$ -operation  $\lambda : SO(X) \rightarrow P(X)$  as follows:

$$\lambda(A) = \begin{cases} A & \text{if } A = \{a\}, \\ X & \text{otherwise.} \end{cases}$$

$SO(X) = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ .

$SO_\lambda(X) = \{\emptyset, \{a\}, X\}$ .

$SO_{\lambda_{co}}(X) = \{\emptyset, X\}$ .

We have  $X$  is  $\lambda_{co}$ -connected, but it is not  $\lambda$ -connected.

**Definition 3.9.** Let  $X$  be a space and  $A \subseteq X$ . The  $\lambda_{co}$ -boundary of  $A$ , denoted by  $\lambda_{co}Bd(A)$ , is defined as the set  $\lambda_{co}Bd(A) = \lambda_{co}Cl(A) \cap \lambda_{co}Cl(X \setminus A)$ .

**Theorem 3.10.** A space  $X$  is  $\lambda_{co}$ -connected if and only if every nonempty proper subspace has a nonempty  $\lambda_{co}$ -boundary.

Suppose that a nonempty proper subspace  $A$  of a  $\lambda_{co}$ -connected space  $X$  has empty  $\lambda_{co}$ -boundary. Then  $A$  is  $\lambda_{co}$ -open and  $\lambda_{co}Cl(A) \cap \lambda_{co}Cl(X \setminus A) = \emptyset$ . Let  $p$  be a  $\lambda_{co}$ -limit point of  $A$ . Then  $p \in \lambda_{co}Cl(A)$ , but  $p \notin \lambda_{co}Cl(X \setminus A)$ . In particular  $p \notin (X \setminus A)$  and so  $p \in A$ . Thus  $A$  is  $\lambda_{co}$ -closed and  $\lambda_{co}$ -open. By Theorem 3.6,  $X$  is  $\lambda_{co}$ -disconnected. This contradiction gives that  $A$  has a nonempty  $\lambda_{co}$ -boundary.

Conversely, suppose  $X$  is  $\lambda_{co}$ -disconnected. Then by Theorem 3.6,  $X$  has a proper subspace  $A$  which is both  $\lambda_{co}$ -closed and  $\lambda_{co}$ -open. Then  $\lambda_{co}Cl(A) = A$ ,  $\lambda_{co}Cl(X \setminus A) = (X \setminus A)$  and  $\lambda_{co}Cl(A) \cap \lambda_{co}Cl(X \setminus A) = \emptyset$ . So  $A$  has empty  $\lambda_{co}$ -boundary, a contradiction. Hence  $X$  is  $\lambda_{co}$ -connected. This completes the proof.

**Theorem 3.11.** Let  $(A, B)$  be a  $\lambda_{co}$ -disconnection of a space  $X$  and  $C$  be a  $\lambda_{co}$ -connected subspace of  $X$ . Then  $C$  is contained in  $A$  or in  $B$ .

Suppose that  $C$  is neither contained in  $A$  nor in  $B$ . Then  $C \cap A$ ,  $C \cap B$  are both nonempty  $\lambda_{co}$ -open subsets of  $C$  such that  $(C \cap A) \cap (C \cap B) = \emptyset$  and  $(C \cap A) \cup (C \cap B) = C$ . This gives that  $(C \cap A, C \cap B)$  is a  $\lambda_{co}$ -disconnection of  $C$ . This contradiction proves the theorem.

**Theorem 3.12.** Let  $X = \cup_{\alpha \in I} X_\alpha$ , where each  $X_\alpha$  is  $\lambda_{co}$ -connected and  $\bigcap_{\alpha \in I} X_\alpha \neq \emptyset$ . Then  $X$  is  $\lambda_{co}$ -connected.

Suppose on the contrary that  $(A, B)$  is a  $\lambda_{co}$ -disconnection of  $X$ . Since each  $X_\alpha$  is  $\lambda_{co}$ -connected, therefore by Theorem 3.11,  $X_\alpha \subseteq A$  or  $X_\alpha \subseteq B$ . Since  $\bigcap_{\alpha \in I} X_\alpha \neq \emptyset$ , therefore all  $X_\alpha$  are contained in  $A$  or in  $B$ . This gives that, if  $X \subseteq A$ , then  $B = \emptyset$  or if  $X \subseteq B$ , then  $A = \emptyset$ . This contradiction proves that  $X$  is  $\lambda_{co}$ -connected. Which completes the proof.

Using Theorem 3.12, we give a characterization of  $\lambda_{co}$ -connectedness as follows:

**Theorem 3.13.** *A space  $X$  is  $\lambda_{co}$ -connected if and only if for every pair of points  $x, y$  in  $X$ , there is a  $\lambda_{co}$ -connected subset of  $X$ , which contains both  $x$  and  $y$ .*

The necessity is immediate since the  $\lambda_{co}$ -connected space itself contains these two points. For the sufficiency, suppose that for any two points  $x, y$ ; there is a  $\lambda_{co}$ -connected subspace  $C_{(x,y)}$  of  $X$  such that  $x, y \in C_{(x,y)}$ . Let  $a \in X$  be a fixed point and  $\{C_{(a,x)} : x \in X\}$  a class of all  $\lambda_{co}$ -connected subsets of  $X$ , which contain the points  $a, x$ . Then  $X = \bigcup_{x \in X} C_{(a,x)}$  and  $\bigcap_{x \in X} C_{(a,x)} \neq \emptyset$ . Therefore, by Theorem 3.12,  $X$  is  $\lambda_{co}$ -connected. This completes the proof.

**Theorem 3.14.** *Let  $C$  be a  $\lambda_{co}$ -connected subset of a space  $X$  and  $A \subseteq X$  such that  $C \subseteq A \subseteq \lambda_{co}Cl(C)$ . Then  $A$  is  $\lambda_{co}$ -connected.*

It is sufficient to show that  $\lambda_{co}Cl(C)$  is  $\lambda_{co}$ -connected. On the contrary, suppose that  $\lambda_{co}Cl(C)$  is  $\lambda_{co}$ -disconnected. Then there exists a  $\lambda_{co}$ -disconnection  $(H, K)$  of  $\lambda_{co}Cl(C)$ . That is,  $H \cap C, K \cap C$  are  $\lambda_{co}$ -open sets in  $C$  such that  $(H \cap C) \cap (K \cap C) = (H \cap K) \cap C = \emptyset$  and  $(H \cap C) \cup (K \cap C) = (H \cup K) \cap C = C$ . This gives that  $(H \cap C, K \cap C)$  is a  $\lambda_{co}$ -disconnection of  $C$ , a contradiction. This proves that  $\lambda_{co}Cl(C)$  is  $\lambda_{co}$ -connected.

#### 4. $\lambda_{co}$ -components and $\lambda_{co}$ -locally connected spaces

In this section a new types of  $\lambda_{co}$ -component of a space  $X$  and  $\lambda_{co}$ -locally connected space are defined, studied and characterized and finally some of its properties are established.

**Definition 4.1.** *A maximal  $\lambda_{co}$ -connected subset of a space  $X$  is called a  $\lambda_{co}$ -component of  $X$ . If  $X$  itself is  $\lambda_{co}$ -connected, then  $X$  is the only  $\lambda_{co}$ -component of  $X$ .*

Next we study the properties of  $\lambda_{co}$ -components of a space  $X$ .

**Theorem 4.2.** *Let  $(X, \tau)$  be a topological space. Then:*

1. *For each  $x \in X$ , there is exactly one  $\lambda_{co}$ -component of  $X$  containing  $x$ .*
2. *Each  $\lambda_{co}$ -connected subset of  $X$  is contained in exactly one  $\lambda_{co}$ -component of  $X$ .*
3. *A  $\lambda_{co}$ -connected subset of  $X$ , which is both  $\lambda_{co}$ -open and  $\lambda_{co}$ -closed is a  $\lambda_{co}$ -component, if  $\lambda$  is  $s$ -regular.*
4. *Every  $\lambda_{co}$ -component of  $X$  is  $\lambda_{co}$ -closed in  $X$ .*

(1)-Let  $x \in X$  and  $\{C_\alpha : \alpha \in I\}$  be a class of all  $\lambda_{co}$ -connected subsets of  $X$  containing  $x$ . Put  $C = \bigcup_{\alpha \in I} C_\alpha$ , then by Theorem 3.12,  $C$  is  $\lambda_{co}$ -connected and  $x \in C$ . Suppose  $C \subseteq C^1$ , for some  $\lambda_{co}$ -connected subset  $C^1$  of  $X$ . Then  $x \in C^1$  and hence  $C^1$  is one of the  $C_\alpha$ 's and hence  $C^1 \subseteq C$ . Consequently  $C = C^1$ . This proves that  $C$  is a  $\lambda_{co}$ -component of  $X$ , which contains  $x$ .

(2)-Let  $A$  be a  $\lambda_{co}$ -connected subset of  $X$ , which is not a  $\lambda_{co}$ -component of  $X$ . Suppose that  $C_1, C_2$  are  $\lambda_{co}$ -components of  $X$  such that  $A \subseteq C_1$ ,  $A \subseteq C_2$ . Since  $C_1 \cap C_2 \neq \emptyset$ ,  $C_1 \cup C_2$  is another  $\lambda_{co}$ -connected set which contains  $C_1$  as well as  $C_2$ , this contradicts the fact that  $C_1$  and  $C_2$  are  $\lambda_{co}$ -components. This proves that  $A$  is contained in exactly one  $\lambda_{co}$ -component of  $X$ .

(3)-Suppose that  $A$  is a  $\lambda_{co}$ -connected subset of  $X$  which is both  $\lambda_{co}$ -open and  $\lambda_{co}$ -closed. By (2),  $A$  is contained in exactly one  $\lambda_{co}$ -component  $C$  of  $X$ . If  $A$  is a proper subset of  $C$ , and since  $\lambda$  is  $s$ -regular, therefore  $C = (C \cap A) \cup (C \cap (X \setminus A))$  is a  $\lambda_{co}$ -disconnection of  $C$ , a contradiction. Thus,  $A = C$ .

(4)-Suppose a  $\lambda_{co}$ -component  $C$  of  $X$  is not  $\lambda_{co}$ -closed. Then, by Theorem 3.14,  $\lambda_{co}\text{Cl}(A)$  is  $\lambda_{co}$ -connected containing a  $\lambda_{co}$ -component  $C$  of  $X$ . This implies  $C = \lambda_{co}\text{Cl}(A)$  and hence  $C$  is  $\lambda_{co}$ -closed. This completes the proof.

We introduce the following definition

**Definition 4.3.** *A space  $X$  is said to be locally  $\lambda_{co}$ -connected if for any point  $x \in X$  and any  $\lambda_{co}$ -open set  $U$  containing  $x$ , there is a  $\lambda_{co}$ -connected and  $\lambda_{co}$ -open set  $V$  such that  $x \in V \subseteq U$ .*

**Theorem 4.4.** A  $\lambda_{co}$ -open subset of  $\lambda_{co}$ -locally connected space is  $\lambda_{co}$ -locally connected.

Let  $U$  be a  $\lambda_{co}$ -open subset of a  $\lambda_{co}$ -locally connected space  $X$ . Let  $x \in U$  and  $V$  a  $\lambda_{co}$ -open nbd of  $x$  in  $U$ . Then  $V$  is a  $\lambda_{co}$ -open neighborhood of  $x$  in  $X$ . Since  $X$  is  $\lambda_{co}$ -locally connected, therefore there exists a  $\lambda_{co}$ -connected,  $\lambda_{co}$ -open neighborhood  $W$  of  $x$  such that  $x \in W \subseteq V$ . So that  $W$  is also a  $\lambda_{co}$ -connected and  $\lambda_{co}$ -open neighborhood  $x$  in  $U$  such that  $x \in W \subseteq U \subseteq V$  or  $x \in W \subseteq V$ . This proves that  $U$  is  $\lambda_{co}$ -locally connected.
